

Virtual Infrastructure Health Check

Does Your Virtualization System Need a Health Check?

Virtualization is being rolled out by companies everywhere faster than any other IT initiative in recent years. Such fast-tracked projects sometimes fall victim to errors from assumptions, guesses and shortcuts.

Catch those small errors before they become big problems.

Most company executives like to know that they are doing the right things...that their company is performing to its fullest capacity. But how do you really know this? How do you know there isn't some small problem in your virtualization project just waiting to trip you up and cost you money? You don't...unless you have an audit done to identify the areas of deficiency and catch those small errors before they become big problems.

Datatrend's Virtual Infrastructure Health Check does exactly that. Our experienced VMware® consultants will analyze your infrastructure to see what you are doing and how you are doing it and compare that to industry best practices. We provide a full color-coded report that will show you exactly how well your virtualization

The Virtual Infrastructure Health Check:

- Documents the inventory of systems analyzed
- Helps you gauge how well the virtual infrastructure is configured and being used relative to VMware best practices, and identify areas needing attention and/or remediation
- Serves as a reference to continue to review best practices and issues discussed during the onsite visit

program is working. Is it functioning as well as it should be? Are you optimizing utilization of your system? Have you explored all the features and capabilities of the software? Do you have sufficient redundancy and resilience?

A Health Check doesn't take long to do...often as little as one day...and we have yet to see an analysis that did not produce some information of value to the company. Health Check can help you identify opportunities for improvement. Do you need training to improve the skills of your personnel? Have you kept up-to-date with the new capabilities provided by each new release of VMware? Do you recognize the value of these features and how to apply them? How can you take advantage of every opportunity VMware affords?

In these challenging times, everyone wants to know how to do things faster, more efficiently and more cost effectively.

In these challenging times, everyone wants to know how to do things faster, more efficiently and more cost effectively. A Virtual Infrastructure Health Check can help you maximize the potential of your virtualization system and rest assured that you are truly doing the best job you can do.
